Introduction

Under the MISA program, the Organic Chemical Manufacturing (OCM) Sector was required to monitor its discharges (both process and cooling waters) for acute lethality to trout and to *Daphnia magna* by conducting laboratory toxicity tests. Specific details on the toxicity testing requirements may be found in the General Effluent Monitoring Regulation (Ontario Regulation 695/88) and the Effluent Monitoring Regulation For The Organic Chemical Manufacturing Sector (Ontario Regulation 209/89). The majority of the OCM Sector companies are located in southern Ontario. An overview of the sector is described in the publication "The Development Document For The Effluent Monitoring Regulation For The Organic Chemical Manufacturing Sector, Env. Ontario 1989".

Toxicity information collected under the MISA effluent monitoring program will form the most comprehensive database available on the Organic Chemical Manufacturing Sector and will be used toward the development of compliance limits for acute toxicity. This report presents the toxicity results of the second six months of self-monitoring, from April 1, 1990 to September 30, 1990, along with the results of Ministry inspection samples that were tested at the Ministry’s laboratory in Rexdale. Toxicity tests of some intake waters were also submitted by industry and these have been included in this report. The results of toxicity testing for the first six months of industry monitoring, from October 1989 to March 1990, were reported in " Acute Lethality Data For Ontario’s Organic Chemical Manufacturing Sector Effluents Covering The Period From October 1989 To March 1990, Env. Ontario 1991 ". Although this report is focused on the second six months of monitoring, the Conclusion section does provide a brief overview on the complete year of monitoring.

Background

In general, toxicity tests are used as a rapid technique to assess the potential impact of complex effluents on the aquatic environment. The tests have been designed to answer whether or not an effluent produces an effect on a biological system and the degree of the measured effect. In acute lethality testing, aquatic organisms are exposed to undiluted effluent, and several effluent dilutions, for a fixed period of time. The toxicity test protocols require a 96 hour exposure for trout and a 48 hour exposure for *Daphnia*. For both tests, the number of organisms which have died is the measured parameter. The LC50 or the estimated concentration of effluent that causes 50 % mortality is generally used as the quantitative measure of toxicity. For complex waste water samples, the LC50 measurement is usually expressed as a percentage of effluent volume. For example, a 96 hour LC50 = 35 % can be explained as the percent by volume of effluent required to kill 50 % of the test fish within a 96 hour exposure period. LC50 percentages are inversely related to the degree of toxicity; lower numbers representing greater effect. Effluent samples where no animals die in full strength (100 %) effluent or in any of the diluted

concentrations are considered non-lethal. Non-lethal effluents are considered less likely to produce adverse impacts in the environment after dilution. For bioassays where only one or two mortalities occur, and the data does not support the calculation of an LC50, the acute lethality is usually reported as " > 100 % ". This designation indicates that mortalities occurred during the test, but the LC50 cannot be accurately calculated from the data and is probably greater than full strength effluent.

As directed by the Effluent Monitoring Regulation, the Organic Chemical Manufacturing Sector was required to collect and provide information on its operations including analytical chemical characterization and toxicity analysis of its waste water discharges. The timing of toxicity sampling was arranged to coincide with chemical characterization. Monthly full dilution toxicity tests were required by regulation for both species. However, for the trout test, if mortality was less than 3 out of the 10 fish exposed then in subsequent months a single concentration test could be used. For cooling water effluent, the required frequency of sampling and testing was quarterly. All acute lethality testing by the Sector plants were conducted according to Ministry protocols (Protocol To Determine The Acute Lethality Of Liquid Effluents To Fish, Env. Ontario, July 1983 and Daphnia magna Acute Lethality Toxicity Test Protocol, Env.Ontario, April 1988). The regulations also required specific information on sampling and testing procedures for each bioassay, in addition to the mortality data. All data was reported in an electronic and hardcopy report. The Ministry's TOXDATA computer program was provided to industry as a method of managing toxicity data and as a route for data submission. Additional information on this computer program is provided in the publication titled " Toxicity Relational Database System TOXDATA User's Manual, Env. Ontario, May 1989".

Discussion

General

The Organic Chemical Manufacturing Sector plants submitted data for 55 sampling locations at a total of 25 plants for the second six months of monitoring. Starting in April 1990 and ending September 1990, a total of 552 trout and Daphnia toxicity test results were submitted by the plants. An additional 60 inspection tests were conducted by the Aquatic Toxicity Unit of Environment Ontario.

BTL Specialty Resins, located in Belleville, ceased operation in April, 1990 and were no longer required to monitor under the Regulation. BASF Canada Inc. (Sarnia), Du Pont Canada Inc.(Corunna), Du Pont Canada Inc.(Maitland), Esso Chemical Canada (Sarnia), and Uniroyal Chemical Ltd. (Elmira) voluntarily submitted acute toxicity test results on intake water samples.

The data collected during this six months of monitoring indicated that the majority of the organic chemical sector's effluents were not acutely lethal. Over 82% of the samples
tested for trout toxicity and 63 % of the samples tested for Daphnia toxicity were determined to have been non-lethal by standard testing methods. Most of the samples that were acutely lethal to trout and/or Daphnia originated from sites at the following six plants: Cornwall Chemicals Ltd. (Cornwall), Courtaulds Fibres Canada (Cornwall), Du Pont Canada Inc. (Whitby), Ethyl Canada (Corunna), GE Plastics Canada Ltd. (Cobourg) and Rohm & Haas Canada Inc. (Scarborough). All these plants reported that one or more of their discharges were acutely lethal to Daphnia and/or trout, at least 50 % of the time when sampled.

Trout Test Results

Of the 277 samples that were tested for acute toxicity to trout, 227 (82.0 %) were not acutely lethal. This is a marginal improvement from the first six months of monitoring when 80.5 % of the samples were reported non-lethal. The effluent samples collected from 10 of the 25 plants were consistently not acutely lethal. Companies included in the non-lethal effluent category were: AKZO Chemicals Ltd. (Sarnia), B.F. Goodrich Canada Inc. (Thorold), BASF Canada Inc. (Sarnia), Celanese Canada Inc. (Millhaven), Du Pont Canada Inc. (Corunna), Esso Chemical Canada (Sarnia), Guardsman Products Ltd. (Cornwall), Morbern Inc. (Cornwall), Novacor Chemicals Ltd. (Moores敦), and Stepan Canada Inc. (Longford Mills). An additional 28 samples, 10.1 % of total, resulted in LC50s > 100 %. Many of these tests had only one fish die during the test and may be interpreted as being not acutely lethal. Eight plants have one or more test results with a LC50 > 100 %. This category included the following companies: Canadian Oxy Chemicals Ltd. (Fort Erie), Chinook Group (Sombra), Du Pont Canada Inc. (Kingston), Du Pont Canada Inc. (Maitland), Ethyl Canada Inc. (Corunna), Polysar Rubber Corporation (Sarnia), Rohm and Haas Canada Inc. (Morrisburg) and Uniroyal Chemical Ltd. (Elmira).

Twenty-two samples, 7.9 % of the total number of samples tested, were acutely-lethal to trout (96 hour LC50 < 100 %). Most of the lethal samples were collected from process and combined effluents. All the lethal samples were collected from seven plants. This category included the following: Amoco Canada Petroleum Company Ltd. (Sarnia), Cornwall Chemicals Limited (Cornwall), Courtaulds Fibres Canada (Cornwall), Du Pont Canada Inc. (Whitby), Dow Chemical Canada Inc. (Sarnia), GE Plastics Canada Ltd. (Cobourg), and Rohm & Haas Canada Inc. (Scarborough). The most lethal samples were sampled from Courtaulds Fibres Canada (Cornwall) where the 96 hour LC50s ranged from 1.5 % to 80.6 %.

Daphnia magna Test Results

Of the 275 samples tested for acute toxicity to Daphnia magna, 175 samples (63.6 %) were not acutely lethal. The effluents from; AKZO Chemicals Ltd. (Sarnia), BASF Canada Inc. (Sarnia), Canadian Oxy Chemicals Ltd. (Fort Erie), Celanese Canada Inc. (Millhaven), Du Pont Canada Inc. (Corunna), Esso Chemical Canada (Sarnia), Guardsman Products Ltd. (Cornwall), Morbern Inc. (Cornwall), and Novacor Chemicals Ltd. (Moores敦) were
not acutely lethal to *Daphnia*. An additional 63 samples (23.9 %) had 48 hour LC50s > 100 %. Many of these samples had only one neonate die during the test, and might be interpreted as being not acutely lethal. Seven plants have one or more test results with an LC50 > 100 %. Included in this category were: Amoco Canada Petroleum Company Ltd. (Sarnia), B.F. Goodrich Canada Inc. (Thorold), BASF Fibres Inc. (Arnprior), Dow Chemical Canada Inc. (Sarnia), Polysar Rubber Corporation (Sarnia), Rohm & Haas Canada Inc. (Morrisburg), and Stepan Canada Inc. (Longford Mills).

Thirty-seven of the 275 samples (13.5 %) were acutely lethal to *Daphnia*, generating 48 hour LC50s < 100 %. All the lethal samples were from following ten companies: Cornwall Chemicals Ltd. (Cornwall), Chinook Group (Sombra), Courtaulds Fibres Canada (Cornwall), Du Pont Canada Inc. (Whitby), Du Pont Canada Inc. (Kingston), Du Pont Canada Inc. (Maitland), Ethyl Canada Inc. (Corunna), GE Plastics Canada Ltd. (Cobourg), Rohm & Haas Canada Inc. (Scarborough) and Uniroyal Chemical Ltd. (Elmira). The effluents from Courtaulds Fibres Canada process outfalls 0100 and 0300 were consistently among the most lethal to *Daphnia* in this sector. The LC50 values for these outfalls ranged from 0.7 % to 40.7 % effluent.

Conclusions

In general, the reporting of toxicity data by the industries went smoothly. The data was usually submitted accurately and according to schedule. Where the Ministry requested industry for data resubmission to correct data entry errors and/or for additional information, the companies complied. Where Ministry audit samples were collected and tested, the results were consistent with results submitted by industry.

The full year of MISA acute toxicity data for the Organic Chemical Manufacturing Sector indicated that the majority of organic chemical plant effluent samples were not acutely lethal. Effluent samples collected from AKZO Chemical Ltd., BASF Canada Inc. (Sarnia), Celanese Canada Inc., Esso Chemical Canada Inc., Guardsman Products Ltd., Morbern Inc., and Novacor Chemicals Ltd. were consistently not acutely lethal to *Daphnia* and trout throughout the monitoring period. Over the full year, only four plants, Courtaulds Fibres Canada, Cornwall Chemicals Company, G.E. Plastics Canada Ltd., and Rohm & Haas Canada Inc. (Scarborough) were in the category where at least 50 % of the samples collected from a discharge were lethal to *Daphnia* and/or trout. However, the results for Rohm & Haas (Scarborough) were based on only two samples. The plant has since installed equipment to eliminate the discharge.

The toxicity report for the first six-months (October 1989 to March 1990) identified Uniroyal’s effluents as consistently lethal to *Daphnia* and causes of the toxicity were not conclusive. The second six month period reported only one sample as acutely lethal to *Daphnia*. The sample collected from the cooling water discharge 0200 on May 22, 1990 produced a LC50 of 39.7 %. Uniroyal reduced its use of municipal (well) water and used
Canagagigue Creek for cooling water between November 27, 1989 and May 22, 1990. The change from municipal to creek water plus storm and drainage effects contributing to the cooling water effluent may reflect the toxic conditions during this period. Ten of the thirteen combined effluent samples collected during the second six-month period were non-lethal and the remaining had LC50s > 100 % effluent. Process changes at the plant eliminated 0600 as a discharge point by sealing it off.

For several of the toxic samples, a quick review of the matching analytical chemistry monitoring data has revealed some probable causes of the observed acute toxicity. Where this was possible, a brief explanation to the probable causes of toxicity are described below. The toxicity tests will detect harmful concentrations of chemical constituents in the effluents. Compliance with "end of pipe" limits for acute toxicity does not necessarily control the potential effects of environmental contamination that can be caused by loading of bioaccumulative substances. These substances are generally non-polar organic chemicals of high molecular weight and low water solubility or metals that can be accumulated in their organic form. For this industrial sector, several of these contaminants have been measured in some effluents at sublethal concentrations. This list includes chlorinated dibenzodioxins, dibenzofurans, tri-alkyl lead and mercury.

Courtaulds Fibres Canada, Cornwall

Courtaulds Fibres Canada produces rayon by treating sulphite pulp with alkali, carbon disulphide and sulfuric acid. The plant effluent is discharged continuously into the St. Lawrence River through diffusers. Historically, the effluent has been assessed as acutely lethal to aquatic life. Effluent toxicity has been caused by the discharge of waste acids, zinc and alkalis used in the process.

Of all the samples tested during the monitoring period, only Courtaulds 0100 and 0300 sewer effluent samples were consistently acutely lethal to both trout and Daphnia. The lethality observed in samples collected from control points 0100 and 0300 can be attributed to the high concentrations of zinc, sulphide and extreme pH conditions. Daphnia and trout appear to be equally sensitive to Courtaulds effluent. The wastewater discharged through sewer 0100 had a measured pH of 2.0 or lower on the days when sampled for toxicity. Sewer 0300 had a measured pH of 11.0 or higher. This extreme acid or alkali condition, alone would account for the lethality observed in the bioassays. In addition, zinc and sulphide concentrations were at lethal levels and would also have contributed to the effluent toxicity. Sulphide and zinc concentrations were measured as high as 167 ppm and 81 ppm, respectively, on the days when samples were collected for toxicity testing.
Cornwall Chemicals Ltd., Cornwall

Cornwall Chemicals Limited manufactures carbon tetrachloride and carbon disulphide which are sold as feedstock to other industries. Process wastewater is neutralized and passed through a three stage settling pond prior to combining with other industrial discharges before discharging into the St. Lawrence River. The process effluent is consistently acutely lethal to Daphnia and only sporadically lethal to trout. Most of the toxicity can be attributed to elevated concentrations of carbon tetrachloride and sulphides. Carbon tetrachloride concentrations were measured as high as 35 ppm when toxicity samples were collected. This concentration is at the lethal threshold for some fish and aquatic invertebrates. Sulphide concentrations were measured as high as 5.5 ppm. Sulphide ions react with the hydrogen ions in water to form hydrogen sulphide. The quantity of hydrogen sulphide formed is dependent on the acidity of the water. The toxicity of sulphide solutions to fish increases as pH decreases. Inorganic sulphides have proved fatal to aquatic life at concentrations between 0.5 and 1.0 ppm, even in neutral solutions.

GE Plastics Canada Ltd., Cobourg

During the period that the MISA monitoring program was carried out (Oct. 1989 to Sept. 1990), GE Plastics Canada Ltd. produced ABS pellets and intermediate resin at their Cobourg facility. However, the resin manufacturing process, which included reacting acrylonitrile, styrene and polybutadiene latex with peroxide initiators, was discontinued in April 1992 as part of a downsizing of the Cobourg manufacturing facilities. The plant continues to produce ABS pellets which are manufactured from resins imported from GE Plastics facilities in the U.S.

During the monitoring year, the process wastewater was sent to primary and secondary treatment prior to discharge into Lake Ontario. This treatment system included a primary "holding" pond, a primary clarifier, a secondary "holding" pond, an aeration basin (biological treatment) and a secondary clarifier. Since the latter part of the MISA monitoring period (June 1990), the treatment system has been modified to include an equalization tank (secondary pond removed) and a tertiary treatment system (dual sand filters). These wastewater treatment processes continue in operation despite the recent downsizing and have resulted in improved effluent quality.

The year of monitoring showed that the effluent samples from GE Plastics Canada Ltd. were lethal the majority of the times when tested with trout. Eight of twelve combined effluent samples were acutely lethal to trout with LC50s ranging from 14.1 % to 80.6 %. The second six-months of monitoring showed an improvement in the quality of the effluent with respect to acute toxicity. Three of the six effluent samples were acutely lethal to trout with LC50s ranging from 25.5 % to 41.8 %. The other samples were non-lethal. Daphnia
were less sensitive than trout to this effluent, only one of the twelve samples were acutely lethal. The toxicity of the effluent may be attributed to the high concentrations of ammonia. The Long Term Average (LTA) concentration for total ammonia was 28.0 ppm for the first six months of the MISA program and the LTA was 12.3 ppm for the second six months.

The data in the Appendix, presents the summaries of the acute lethality results, grouped by company in alphabetic order. These summary pages are part of the complete database, that includes the Toxicity Test Report submitted by industry for each test sample. The complete database is available from Environment Ontario upon request. The results of Ministry inspection tests are also presented in the individual summaries. The comment fields on individual Toxicity Test Reports were entered by the industry’s laboratory performing the tests, and may not to be consistent across samples and may not necessarily represent the views of the Ministry.
Appendix
SUMMARY
The data for two trout bioassays, conducted on cooling water samples collected between April and September 1990, were provided by AKZO Chemicals Ltd. Both cooling water samples were not acutely lethal to test fish.

SUMMARY
The data for nine trout bioassays, conducted on storm water samples collected between April and December 1990, were provided by Amoco Canada Petroleum Canada Limited. One storm water sample was acutely lethal to test fish. Statistically, the percentage effluent required to kill 50 % of the test fish by the end of the four days exposure was 80.2 %. Eight of the ten remaining samples were non-lethal and the other produced a 96 hour LC50 > 100 %. A Ministry audit sample, collected in June, had a LC50 > 100 %.

SUMMARY  
The data for nine acute lethality Daphnia tests conducted on Storm water samples collected between April and December 1990, were submitted by Amoco Canada Petroleum Canada Ltd. Five were non-lethal and four samples have LC50s of greater than 100% effluent. A Ministry audit sample, collected in June from the Storm water effluent, was determined acutely lethal with a LC50 of 5.5%.

The data for four trout bioassays, conducted on cooling water and intake water samples collected between April and September 1990, were provided by BASF Canada Incorporated. Cooling water samples from both discharge locations, control points 0100 and 0200, were not acutely lethal to test fish. Intake water samples were also non-lethal. Two Ministry audit samples, collected from the OT cooling water sewers in July, were also non-lethal.

SUMMARY
Data for four Daphnia magna acute lethality toxicity tests conducted on samples once through cooling water (outfalls #100 and 200) collected between April and September 1990 have been submitted by BASF Canada Inc. of Sarnia. For both cooling water discharges, two of the three samples were non-lethal while the remaining had a LC50 > 100% effluent. Both intake water samples were non-lethal. Ministry audit samples, collected from OT cooling water in July, had LC50s > 100%.

SUMMARY  
The data for six Daphnia magna acute lethality toxicity tests conducted on samples of combined effluent collected between April and September 1990 were submitted by Chinook Chemicals Company of Sombra. One sample was not acutely lethal to Daphnia, three samples had LC50s greater than 100%, and two samples were acutely lethal to Daphnia. Statistically, the percentage effluent required to kill 50 % of the test fish by the end of the two days exposure were 4.1 % and 65.5 % effluent. A Ministry audit sample, collected in July from the combined effluent, was non-lethal.

COMPANY: Courtaulds Fibres Canada, Cornwall (1900000)
SECTOR: Organic Chemical
REGION: Southeast

SUMMARY
The data for thirty-five trout bioassays, conducted on effluent samples collected between April and September 1990, provided by Courtaulds Fibres Canada. All eleven samples of process effluent collected from control point 0100 and 0300 were acutely lethal to test fish. For samples collected from 0100, statistically, the percentage effluent required to kill 50% of the test fish by the end of the four days exposure were 1.5%, 1.9%, 51.0%, 3.3%, and 1.6%. For samples collected from 0300, statistically, the percentage effluent required to kill 50% of the test fish by the end of the four days exposure were 28.3%, 14.1%, 16.6%, 10.0%, 14.1% and 10.5%. Nineteen of the twenty-four combined effluent samples were not acutely lethal. Three of the remaining samples produced LC50s > 100% and the two other samples were acutely lethal to test fish. A sample of combined effluent discharge from pipe # 500 produced a 96 hour LC50 80.65%. A sample of combined effluent discharge from pipe # 800 produced a 96 hour LC50 51.5%. Two of three Ministry audit samples, collected from combined effluents, produced LC50s > 100% and the remaining sample was non-lethal.

SUMMARY
The data for thirty-four Daphnia magna acute lethality toxicity tests conducted on effluent samples collected between April and September 1990 were submitted by Courtaulds Fibres Canada of Cornwall. Statistically, the percentage effluent required to kill 50% of the test Daphnia by the end of two days exposure ranged from 0.7% to 40.6% effluent. Twenty-four samples were collected from the four combined effluent discharge sites and were tested for acute toxicity. Only one of the samples, from discharge # 800, was acutely lethal. The sample had a LC50 of 40.8% effluent. Of the remaining samples, thirteen were non-lethal and ten had LC50s > 100% effluent. Two of three Ministry audit samples, collected from combined effluents were non-lethal, and the remaining had a LC50 > 100%.

SUMMARY
The data for forty-two trout bioassays, conducted on combined effluent and once through cooling water effluent samples collected between April and September 1990, were provided by Dow Chemical Canada Inc. All thirty six of these samples were not acutely lethal to test fish. In addition, six trout bioassays were conducted on process effluent (1200) samples during the same period. Five of these samples were non lethal while the remaining was acutely lethal. Statistically, the percentage effluent required to kill 50 % of the test fish in 96 hours was 68.8 %.

SUMMARY
The data for forty-two Daphnia magna acute lethality toxicity tests conducted on samples of effluent collected between April and September 1990 were submitted by Dow Chemical Canada Inc. of Sarnia. For the five combined effluent discharge points, thirty-three samples were collected and tested for acute toxicity to Daphnia. Twenty of these samples were not acutely lethal, and the remaining thirteen samples had LC50s > 100% effluent. Three samples were collected from each of two once through cooling water discharge sites. All six samples were non-lethal. Five of the six process effluent samples were not acutely lethal and the remaining had a LC50 > 100% effluent.

**SUMMARY**
The data for twelve *Daphnia magna* acute lethality toxicity tests were conducted on samples of combined effluent collected between April and September 1990 were submitted by DuPont Canada Inc. of Kingston. Five of six samples from combined effluent #700 were not lethal to *Daphnia*. The remaining sample was lethal to *Daphnia* and its 48 hour LC50 was estimated to be between 50.0 % and 100 %. Four of six samples collected from combined effluent # 1100 were not acutely lethal, while the other two samples have LC50s > 100 % effluent.

SUMMARY
The data for six Daphnia magna acute lethality toxicity tests conducted on samples of combined effluent collected between April and September 1990 were submitted by Du Pont Canada Inc. of Maitland. Two of six samples of combined effluent were acutely lethal to Daphnia. LC50s for these samples were 42.0 % and 39.9 %. Of the remaining samples, two were not acutely lethal and two had LC50s > 100 % effluent. A Ministry audit sample, collected in September, was non-lethal.

SUMMARY
The data for twenty-one trout bioassays, conducted on combined effluent samples and once through cooling water effluent samples collected between April 1990 and December 1990, were provided by Du Pont Canada Incorporated. Six of the nine combined effluent samples were not acutely lethal to test fish. Of the remaining samples, two were acutely lethal with LC50s of 51.0 and 75.0% and the other sample had a LC50 > 100%. Nine of twelve once through cooling water effluent samples were not acutely lethal. The other three samples had LC50s > 100% effluent. A Ministry audit sample, collected in September from the combined effluent discharge was acutely lethal with a LC50 of 73.8%. Two of four Ministry audit samples collected from the OTCW effluent, had LC50 > 100% and the remaining samples were non-lethal.

SUMMARY
The data for twenty-one bioassays conducted on samples collected from the combined effluent and once through cooling water discharges between April and December 1990 were submitted by Du Pont Canada Incorporated. Six of nine combined effluent (#0200) samples were acutely lethal to Daphnia. Statistically, the percentage effluent required to kill 50% of the test animals by the end of the two days exposure ranged from 16.2% to 100%. Two of three samples were non-lethal. An additional sample collected and tested by the Ministry of the Environment was also lethal to Daphnia. Three of the twelve once through cooling water samples were acutely lethal to Daphnia. Samples collected in April 1990 from discharge pipe # 400, 500 and 600 produced 48 hour LC50s 30.8%, 30.2% and 35.3% respectively. Of the remaining samples, six were not acutely lethal and three had LC50s > 100% effluent.

SUMMARY
The data for eight trout bioassays, conducted on combined effluent and once through cooling water samples collected between April and September 1990, were provided by GE Plastics Canada Limited. Three of the six combined effluent samples were acutely lethal to test fish. Statistically, the percentage effluent required to kill 50% of the test fish by the end of the four days exposure were 25.5, 39.0 and 41.8%. The other three combined effluent samples were non-lethal. One of the two samples of once through cooling water was non-lethal and the remaining had a LC50 > 100%. Two Ministry audit samples, collected in June from the once through cooling water effluent and from the combined effluent discharge were non-lethal.

SUMMARY
The data for eight Daphnia magna acute lethality toxicity tests conducted on samples of once through cooling water and combined effluent collected between April and September 1990, were submitted by G.E. Plastics Canada Ltd. of Cobourg.

One of the six samples of once through cooling water was toxic to Daphnia. Statistically, the percentage effluent required to kill 50 % of the test animals by the end of the two days exposure was 29.4 %. The other five samples were non-lethal.

One of two once through cooling water samples was non-lethal to Daphnia and the other sample had a LC50 > 100 % effluent.

A Ministry audit sample collected from OT cooling water in June, had a LC50 > 100 %. A Ministry audit sample collected from the combined effluent discharge in June was non-lethal.

**Summary**

The data for six Daphnia magna acute lethality toxicity tests conducted on samples of combined effluent collected between April and September 1990 were submitted by Novacor Chemicals Ltd. of Mooretown. All six of the samples were not acutely lethal to Daphnia. A Ministry audit sample, collected in July, had a LC50 > 100 %.

SUMMARY
The data for forty trout bioassays, conducted on process effluent, batch effluent, combined effluent and once through cooling water samples collected between April 1990 and September 1990, were provided by Polysar Limited. Twenty-one of twenty four samples collected from the four combined effluent discharge locations (0200, 0400, 0500, 1100) were non-acutely lethal to test fish. The other three combined effluent samples had LC50s > 100 % effluent. Fourteen of sixteen samples collected from the locations; OTCW 1400, OTCW 1600, batch 1700 and process effluent 1800 were also not acutely lethal to test fish. Only two samples, one collected from Batch and the other from process effluent, had LC50s of > 100 % effluent. Ministry audit samples, collected from each discharge, except for the Batch sample, were non-lethal. The Batch sample had a LC50 > 100 %.

SUMMARY
Data for forty Daphnia magna acute lethality toxicity tests conducted on samples of effluent collected between April and September 1990 were submitted by Polysar Limited of Sarnia. Samples were collected from four combined effluent discharges, two once through cooling water discharges, one batch and one process effluent discharge. Nineteen of the twenty four combined effluent samples were not acutely lethal to Daphnia, while the remaining five samples produced 48 hour LC50s > 100 % effluent. An audit sample collected from the combined effluent discharge # 200, by the Ministry of the Environment in April, however was lethal to Daphnia. Statistically the percentage effluent required to kill 50 % of the Daphnia by the end of the two days was 66.6 %. All once through cooling water samples and Batch effluent samples were non-lethal to Daphnia. Three of six process effluent samples were non-lethal, while the remaining three showed some lethality, producing 48 hour LC50s > 100 %.

SUMMARY
The data for two trout bioassays, conducted on cooling water samples collected between April and December 1990 were provided by Rohm & Haas Canada Inc. One of the samples was acutely lethal to test fish. Statistically, the percentage effluent required to kill 50% of the test fish by the end of the four days exposure was 82.8%. The other sample was non-lethal.

SUMMARY
The data for two Daphnia bioassays, conducted on cooling water samples collected between April and December 1990 were provided by Rohm & Haas Canada Inc. One of the samples was acutely lethal to Daphnia. Statistically the percentage effluent required to kill 50% of the test animals was 3.68%. The other sample was non-lethal.

SUMMARY
The data for five trout bioassays, conducted on combined effluent samples collected between April and September 1990, were provided by Rohm and Haas Canada Incorporated. Two of the five samples were not acutely lethal to trout and the other three samples had LC50s > 100 % effluent. A Ministry audit sample, collected in April, had a LC50 > 100 %.
